21st Century Aeration™

DryJect Launches in Australia

Aerating Has Never Been Easier

Less surface disruption ... More subsurface aeration!!!

Turnpoint Services is pleased to announce the arrival of the new, revolutionary DryJect aeration technology, under exclusive license to operate in Australia and New Zealand.

This is exciting news for golf course managers, superintendents and golfers alike as they can now rely on a playable surface immediately following the aeration process.

What's more, the lost revenue that comes from traditional core aeration is minimised, as is the frustration of golfers no longer having to play on or avoid bumpy putting surfaces.

Turnpoint Services has imported a number of DryJect machines and has already provided the service to several golf courses, including most recently Kingston Heath and St Andrews Beach in Victoria, with outstanding results and positive feedback from management and golfers.

Enclosed is some detailed information on the new DryJect technology and how it can be of benefit to your golf course when compared to either using or outsourcing traditional core aeration.

Also included is a *Response Form* which we would encourage you to complete and return via fax or email, to advise us of your interest in the new DryJect service or attending one of the upcoming demonstrations we will be holding in Victoria, New South Wales and Queensland.

We hope you will see the benefits of incorporating DryJect into your course's regular maintenance routine and look forward to being of service to you in the near future.
